DETAILED ACTION

Response to Arguments

1. Applicant's response to the last Office Action, filed 4/8/2009, has been entered and made of record.
2. Applicant has amended claims 4-11. Claims 1-3,12-13 has been cancelled. Claims 4-11 are currently pending.
3. Applicant's arguments, in the amendment filed 6/8/2009 has been entered and made of record. Claims 4-11 has been previously stated allowable in the last office action.

Allowable Subject Matter

4. Claims 4-11 are allowed.

After reviewing the remarks made by the Applicant in response to the non-final office action the Examiner finds the remarks to be persuasive. The most pertinent prior art is Grunkin et al (US 6,226,393) And Majumbar et al (High resolution Magnetic Resonance Imaging Three dimensiona Trabecular Bone Architecture and Biomechanical Properties). Grunkin discloses estimating the bone quality or skeletal status of a vertebrate on the basis of two-dimensional image data comprising information relating to the cortical bone of at least a part of a bone of the vertebrate, the image data being data obtained by exposing at least the part of the bone to

electromagnetic radiation and by determining at least one value representing a variation of a density of cortical bone of the at least part of the bone, an estimation procedure in which the bone quality or skeletal status of the vertebrate is estimated on the basis of the at least one variation value, and optionally one or more features related to the bone of the vertebrate, and a predetermined relationship between the at least one variation value and optional feature(s) and reference skeletal status or bone quality parameters, wherein the determined value is determined from a grey value difference between oblong density variations in the image data and other parts of the image data the oblong density variations extending at least in a longitudinal direction of the bone. Majumdar et al. teaches the use of logarithmic transform being applied to determine the exponent, a linear model was used to describe the relationship between QCT-determined BMD and modulus and strength. Because the use mechanical resistance using exponential correlation provide an ideal platform for assessing trabecular architecture in vivo, at multiple skeletal sites longitudinally, and assist in understanding the etiology of osteoporotic and aging changes, for studying osteoporosis progression and therapeutic efficacy. Neither Grunkin nor Majumbar discloses :

the structural parameter α is determined, obtained by the following sequence of steps:

- a) choosing a point at random at a first pixel of the two dimensional image, wherein the first pixel has a gray level $h(0)$;**
- b) choosing a straight line starting from the point and have and has a direction also determined at random;**
- c) moving a distance r along this straight line to a new point at a second pixel , $h(r)$ being the**

gray level of the second pixel at the new point

d) computing the variance of the gray

levels with the formula: $V(r)=[h(r)-h(O)]^2$;

e) tracing a curve associated with $V(r)$ on a log-log scale,

and f) determining the slope of the curve which represents said parameter α .

The Examiner finds no reason or motivation to combine the above references in an obviousness rejection thus placing the application in condition for allowance.

Any comments considered necessary by applicant must be submitted on later than the payment of the issue fee and to avoid processing delays should preferably accompany the issue fee. Such submissions should be clearly labeled, comments on statement of reasons for allowance.
